The Gyronix System® is a Major Hit in Switzerland

The **Gyronix System™** has become the backbone of the management system for Swiss utility company Cridor. The Gyronix System has transformed the way the organisation manages its business and project processes, and has enabled major savings in time, operational efficiency and productivity across the business.

In a country where 99.7% of organisations have less than 250 employees, and 70% of those have less than 20 employees, Cridor is fairly typical with 35 staff. A major challenge facing these organisations is finding a management system that is affordable. Most solutions are either designed for larger organisations and therefore too expensive for the SME, or require extensive IT support which again is cost prohibitive.

Emmanuel Maître, Managing director of Cridor, was faced with this challenge and after extensive market research into different management systems found that none of the conventional products provided the total solution that he was looking for within budget constraints.

That was when he was introduced to The Gyronix System, which seamlessly integrates Mindjet's MindManager® mapping software with Gyronix's own ResultsManager™ software.

"I have never believed in the 'tool which does everything', but the combination of ResultsManager with MindManager is the exception…..amazing! They are really becoming the backbone of my management system," commented Maître.

The Gyronix System has provided Maître with a powerful combination of tools, which enables him to professionally manage all levels of the business. On a corporate level the system has enabled the creation and management of an internal information system for ISO management (9001 and 14001). This gives all 35 employees access to ISO documents and all other relevant information for managing the processes they are directly responsible for. This has resulted in major operational efficiencies as time spent on administrative functions has been cut allowing more time to be spent on implementation and achieving our corporate targets.

Secondly, the Gyronix System has dramatically transformed how projects are

managed. The system allows all projects to be effectively managed from pre-start to completion. The initial stage of a project involves brainstorming, facilitating client kick-off meetings and gathering large amounts of information from multiple sources including web sites, manuals, computer files, each involving different team members.

"We have saved many man-hours of work at the start of a project and throughout its life-cycle by using the Gyronix System to catalogue and link all our data in a way that makes it instantly accessible to the whole team. Importantly, this also means that data cannot be lost or misplaced. The results have been so impressive that our suppliers have asked me to help install the system within their own organisations," commented Maître.

The third application is personal organisation, which enables all activities, work and non-work related, to be captured within the same system ensuring that all important deadlines and activities are prioritised and focus is placed on the appropriate actions at relevant time.

"I am amazed and delighted at the results I have gained from using the Gyronix System. No other tool comes close to its flexibility, ease-of-use and application to all levels of business, from corporate management to personal organisation. Colleagues have been so impressed that I'm currently developing a 'productivity power-pack for SME managers' here in Switzerland to help other organisations gain the same benefits for their business as we have gained at Cridor. I have no hesitation in recommending the Gyronix System to any business from the amazing product itself, through to the professional and expert support and constant flow of upgrades and improvements. This has truly become the backbone of our management system," concluded Maître.
